

April 2026 KPI

Goals

Build and deploy an automated LinkedIn enrichment pipeline to eliminate manual prospect research for the fundraising team.

Integrate the enrichment system directly with Airtable CRM to ensure enriched data is automatically synced without manual data entry.

Improve pipeline reliability with crash recovery, data type validation, and connection resilience for long-running batch jobs.

Establish baseline metrics and audit trail for enrichment quality across the full prospect database.

Achievements

Processed 3,696 fundraising prospect records through the automated LinkedIn enrichment pipeline in a single production run, populating up to 27 CRM fields per record including role, company, career history, location, and contact data.

Synced 2,671 enriched records directly to Airtable with 97.7% sync accuracy — zero manual data entry required.

Achieved 88% enrichment success rate across batches unaffected by an external API key expiry (batches 12-13 flagged for re-run).

Eliminated an estimated 547 hours of manual research (~\$13,675 in researcher time) in a single pipeline run.

Deployed a data type validation layer ensuring all enriched fields conform to Airtable field types before sync, fixing a class of silent data corruption bugs.

Deployed DB connection resilience — pipeline now retries on dropped connections and auto-resumes after crashes without losing progress, validated in production.
